

CSE 299: Junior Design Project

Department of Electrical and Computer Engineering, North South University

Semester: Summer 2026	Section: 03	Weekly Progress: 1	Date: 07/07/2026
Faculty: Dr. Mohammad Shifat-E-Rabbi		Group: 4	
Project Title	FoodForward - A Web-Based Food Donation Platform Connecting Donors, Restaurants, and Charities		
Members	Tasmia Anam Aurthy (2223053042) Samia Zaman Pushpita (2232969042) Md Belayet Hossain (2111363642)		

PROGRESS MADE THIS WEEK

Update	What was prepared
1. Class-wise development roadmap	A practical roadmap was prepared for the remaining course timeline. The plan starts with Django setup and a basic homepage, then moves to authentication and user roles, restaurant/charity modules, the main donation workflow, the "Needed Most" feature, testing and final demonstration preparation.
2. Initial database plan	The first database draft was prepared with the main entities: User, Restaurant, Charity, MealPackage, Donation, Payment and Notification. Their basic relationships and implementation order were also outlined.
3. GitHub documentation plan	A project-status update and next-milestone section were prepared for the repository README so the development stage and immediate targets are clear. Separate commits were planned for the roadmap, database draft and README update.
4. Research work continued	The literature review and proposed-solution work are still in progress for the upcoming Class 5 and Class 6 submissions. These are being refined alongside the implementation plan.

CURRENT CHALLENGE

Main challenge: The project has not entered coding yet, so the immediate challenge is to convert the planning work into a small working technical foundation before the next update. The team needs to start with a shared Django project, a simple interface and the first database models while also finishing the literature review.

TARGET FOR NEXT WEEKLY UPDATE

1	Complete the literature review presentation for Class 5 and finalize the selected evidence, research gap and design implications.
2	Initialize the FoodForward Django web project and create the shared project structure, requirements.txt, templates folder and static folder.
3	Create one simple visible interface - a basic FoodForward landing page with HTML, CSS and Bootstrap.
4	Start the first database models for User, Restaurant and Charity based on the prepared database draft.
5	Show regular team activity on GitHub through separate, meaningful commits from the group members.
