

CSE 299: Junior Design Project

Department of Electrical and Computer Engineering, North South University

Semester: Summer 2026	Section: 03	Weekly Progress: 1	Date: 07/07/2026
Faculty: Dr. Mohammad Shifat-E-Rabbi		Group: 4	

Project Title	FoodForward - A Web-Based Food Donation Platform Connecting Donors, Restaurants, and Charities		
Members	Tasmia Anam Aurthy (2223053042) Samia Zaman Pushpita (2232969042) Md Belayet Hossain (2111363642)		

LAST WEEK'S TARGET	FOLLOW-UP
1. Finalize the project scope and main user roles. 2. Define the donation workflow and major features. 3. Organize the proposal work and GitHub repository.	1. Done - donor, restaurant, charity and administrator roles were finalized. 2. Done - the donation flow and status sequence were defined. 3. Done - proposal files and planning materials were organized in the repository.

WORK NARRATIVE OF THE CURRENT WEEK

Work completed: After the proposal presentation, we reviewed the project again and finalized how the system will be developed. The four main roles and the complete donation flow are now clear. We also confirmed the planned technology stack: Django with Python for the backend, MySQL for the database, and HTML, CSS, JavaScript and Bootstrap for the frontend.

Initial implementation planning: Since coding has not started yet, we divided the project into three connected work areas - frontend, backend and database - and agreed to develop one feature at a time. The first technical milestone will be a basic Django project setup, a core application, common templates/static folders and a simple landing page.

Academic preparation: The literature review is still being prepared for Class 5. The proposed-solution work is also in progress for the Class 6 submission, so these are not treated as completed work in this update.

Current challenge

The main challenge was deciding a realistic starting point that fits the course timeline without beginning with advanced features too early.

TARGET FOR NEXT WEEKLY UPDATE

1	Complete the literature review presentation for Class 5. Review the selected sources, research gap and design implications before submission.
2	Start the technical setup. Initialize the Django project and core app, create requirements.txt, and organize the basic templates/static structure.
3	Create the first simple interface. Build a basic FoodForward landing page using HTML, CSS and Bootstrap to show the donor-restaurant-charity flow.
4	Prepare the first data model draft. Outline the initial User, Restaurant and Charity entities and their relationships for the next development stage.
5	Maintain GitHub activity. Push the setup work through clear, separate commits so the repository starts showing regular team progress.
