Group 4

LAST WEEK TARGET → FOLLOW-UP

01 Finalize project scope

DONE Problem, users and academic scope fixed

02 Define system workflow

DONE 9-step donation journey and status model

03 Establish project repository

ACTIVE README, proposal files and planning history

1 SUMMARY

Following the Class 3 proposal milestone, the team strengthened FoodForward's evidence base and system blueprint. The literature review now organizes 13 core scholarly and institutional sources around four review questions, while the proposed solution defines role-based workflows, database entities, security controls, a trackable donation lifecycle, and the demand-aware 'Donate Where It Is Needed Most' allocation concept. The GitHub repository remains in the proposal and planning phase, with 9 commits across three group members.

2 WORK COMPLETED

- **Proposal baseline finalized**
Confirmed the project purpose, four stakeholder roles, core features, technology stack and full donation workflow.
- **Literature review prepared**
Structured four research questions, synthesized key themes, compared platform archetypes and identified the transparency and demand-prioritization gap.
- **Proposed solution refined**
Defined modules, role-based permissions, system architecture, database entities, status transitions and the Needed Most priority factors.
- **Repository collaboration**
Maintained the public repository, improved the README and proposal documentation, and recorded team contributions through commit history.

3 PROGRESS SNAPSHOT

Proposal & scope Complete

Evidence base Prepared

System design Advanced

CURRENT PHASE

Proposal & planning - implementation begins next.

4 CHALLENGES

- Keeping the junior-project scope feasible while preserving the unique allocation feature.
- Turning research findings into measurable, testable features and governance rules.
- Preparing the repository for the course-required structure before coding begins.

5 NEXT STEPS

- Finalize and present the literature review for Class 5.
- Refine the proposed-solution report for Class 6, especially allocation, architecture and requirements.
- Create the Django project skeleton, required GitHub folders and first implementation commits.
